Webinar, **Middle East DOI Consortium**, 11-May-2022

What is a DOI?

- ❑ Persistent Identifier and hyperlink
- ❑ Resolves via Google with any browser
- ❑ Specifies the resource – not the location - Landing page URL
- ❑ Has standard metadata attached - DataCite metadata schema
- ❑ Making research FAIR (**F**indable, **A**ccessible, **I**nteroperable, **R**eusable)
- ❑ Standard DIN ISO 26324 (2012)

Example: <https://doi.org/10.34785/j014.2022.357>

<https://www.doi.org/>

DOIs for Research Output

- 1. Take an article
- 2. Describe it

over all the classes that can occur in that position. Resnik's model was proposed as a model of human learning of selectional preferences that made minimal representational assumptions; it showed how such preferences could be acquired from usage data and an existing conceptual hierarchy. However, his and later computational models (see Section 2) have properties that do not match with certain cognitive plausibility criteria for a child language acquisition model. All these models use the training data in "batch mode", and most of them use information theoretic measures that rely on total counts from a corpus. Therefore, it is not clear how the representation of selectional preferences could be updated in-

Weighted Trimean as a Regressor in the Estimate of Theil-Sen Regression

Necati Alp Erilli

Department of Econometrics, Sivas Cumhuriyet University, Sivas, Turkey

DOI: <https://doi.org/10.15157/IJTIS.2022.5.2.892-906>

Keywords: Theil-Sen Regression Analysis; weighted trimean; non-parametric regression analysis; trimean

Abstract

The most used method in nonparametric regression analysis is the Theil-Sen approach. With this method, all coefficient estimations are made with the median parameter as opposed to parametric methods. The most important criticism in computations with the median parameter is that the impact of extreme values does not participate in calculations. In this study, it was proposed to use the trimean parameter by weighting, which more effectively adds the effect of outliers to the average account in Theil-Sen regression analysis. In applications with 5 data sets, Theil-Sen calculations with weighted trimean were found to be more successful than calculations with the median parameter. Thus, in cases where the outliers are too high or directly affect the data, it can be said that the use of weighted trimean will yield more effective results.

Create and Manage DOIs

Create and manage DOIs for all of your repositories. You can do this through:

- Our primary **REST API** that supports JSON and enables automated DOI registration and
- Our manual interface **Fabrica** that enables you to register DOIs in less than a minute.

Create DOI via web interface Fabrica

DataCite Fabrica

Transient Expression of cor Gene in Papaver somniferum Text

Bahman Hosseini, Farajollah Shahriari-Ahmadi, Haleh Hashemi, Mohammad-Hasan Marashi, Mahdi Mohseniazar, Alireza Farokhzad, Masoume Sabokbari,

Journal Article published 2011 via BioImpacts; ISSN 2228-5660

Introduction: Papaver somniferum is the commercial source of morphine and codeine. The isolation of effective genes involved in the morphine biosynthesis of P. somniferum is very important in the production of specific metabolites achieved using metabolic engineering techniques. In this pathway, the key enzyme COR is involved in the conversion of codeinone to codeine and morphinone to

Update DOI (Form)

More information about DOI registration via form can be found on our [Support Website](#). Required properties are marked with a red asterix.

Required Properties

* **DOI** The globally unique string that identifies the resource and can't be changed.

* **State** The state determines whether a DOI is registered and findable. Once in Registered or Findable state, a DOI can't be set back to Draft state. [More ...](#)

- Draft only visible in Fabrica, DOI can be deleted
- Registered registered with the DOI Resolver
- Findable registered with the DOI Resolver and indexed in DataCite Search

* **URL** The location of the landing page with more information about the resource.

Should be a https URL - within the allowed domain(s) of your repository if domain restrictions are enabled in the repository settings. Http and ftp are also supported.

* **Creators** The main researchers or organizations involved in producing the resource, in priority order.

Name Identifier

Uniquely identifies an individual or legal entity, according to various schemas, e.g. ORCID, ROR or ISNI. Use name identifier expressed as URL. The Given Name, Family Name and Name will automatically be filled out for ORCID and ROR identifiers.

[+ Add another name identifier](#)

Person Organization Unknown

Given Name

The personal or first name of the creator.

Family Name

The surname or last name of the creator.

* **Name (from Given Name and Family Name)**

*** Titles** One or more names or titles by which the resource is known.

Teachers Attitudes towards the Use of Instructional Technology and its Impact on Their Self-efficacy

*** Publisher** The name of the entity that holds, archives, publishes prints, distributes, releases, issues, or produces the resource.

University of Kurdistan

This property will be used to formulate the citation, so consider the prominence of the role.

*** Publication Year** The year when the resource was or will be made publicly available.

2019

Must be a year between 1000 and 2022.

*** Resource Type General** The general type of the resource.

Journal article

If none of the provided values matches, use Other and specify the resource type in the field below.

Testing

- **Test the complete workflow incl. DOI stages in the test environment and resolving to landingpages**
- **The same account credentials work for web interface and the API:**
 - DOI Fabrica (<https://doi.test.datacite.org>)
 - MDS API (Test endpoint: <https://mds.test.datacite.org>)
 - JSON REST API (Test endpoint: <https://api.test.datacite.org>)
- **Assign or request a prefix to/for your repository account**
- **Testing guide:** <https://support.datacite.org/docs/testing-guide> If you have any questions please contact support@datacite.org.

Data from: Relative accuracy of three common methods of parentage analysis in natural populations

Hugo B. Harrison, Pablo Saenz-Agudelo, Serge Planes, Michael L. Berumen & Geoffrey P. Jones
Version 1 of Dataset published 2012 in *DRYAD*

Parentage studies and family reconstructions have become increasingly popular for investigating a range of evolutionary, ecological and behavioral processes in natural populations. However, a number of different assignment methods have emerged in common use, and the accuracy of each may differ in relation to the number of loci examined, allelic diversity, incomplete sampling of all candidate parents, and the presence of genotyping errors. Here we examine how these factors affect the accuracy of three popular parentage inference methods (COLONY, FaMoz and an exclusion-Bayes' theorem approach by Christie et al. (2010a)) to resolve true parent-offspring pairs using simulated data. Our findings demonstrate that accuracy increases with the number and diversity of loci. These were clearly the most important factors in obtaining accurate assignments explaining 75-90% of variance in overall accuracy across 60 simulated scenarios. Furthermore, the proportion of candidate parents sampled had a small but significant impact on the susceptibility of each method to either false positive or false negative assignments. Within the range of values simulated, COLONY outperformed FaMoz, which outperformed the exclusion-Bayes' theorem method. However, with 20 or more highly polymorphic loci, all methods could be applied with confidence. Our results show that for parentage inference in natural populations, careful consideration of the number and quality of markers will increase the accuracy of assignments and mitigate the effects of incomplete sampling of parental populations.
